| COMMENTS | Like most new engines, the 2.3L EcoBoost in your Ranger is starting out with high copper and silicon levels . Both elements are almost certainly related to the normal break-in process, and they should edge closer to universal averages with each oil change. These averages show what's typical for a mature 2.3 L EcoBoost after about 5,200 miles on the oil. Aside from copper, wear metals already look okay compared to averages. Fuel dilution was okay at only 1.5% of the sample, and a low/thin viscosity isn't cause for concern, either. No coolant was found. |
